

# The search for new 4-amino-5-methyl-4H-1,2,4-triazole-3-thion derivatives with diuretic activity

T. V. Kravchenko

Zaporizhzhia State Medical University, Ukraine

1,2,4-Triazole derivatives have been widely used in medical practice due to their wide spectrum of biological activities and low toxicity, as they have 1,2,4-triazole cycle in their structure. That makes 1,2,4-triazole derivatives a very promising and attractive class of organic compounds in research of their physical and chemical properties, and biological activity determining. In order to find new substances with potential biological activity 20 new compounds of 4-amino-5-methyl-4H-1,2,4-triazole-3-thion derivatives were synthesized, which have never been described in literature before.

**The objective** of this study was the research of bioactivity of 4-amino-5-methyl-4H-1,2,4-triazole-3-thion derivatives.

**Materials and methods.** Compounds of research were synthesized in Department of Toxicological and Inorganic Chemistry of ZSMU. Berchin method was used in order to estimate the effect of compounds on excretory function of kidneys.

**Results.** Diuretic activities of 4-amino-5-methyl-4H-1,2,4-triazole-3-thion derivatives were studied. The compounds exhibit both diuretic and antidiuretic effects. It is worth noting that 4-((R-idene)amino)-5-methyl-4H-1,2,4-triazole-3-thion derivatives demonstrated both moderate and high diuretic activity. In such way, introduction of 3,4-methoxybenzyl, 3,5-methoxybenzyl and 2-chloro-6-fluorobenzyl substituents into the structure of 4-((R-idene)amino)-5-methyl-4H-1,2,4-triazole-3-thion slightly increased diuretic effect. Reduction of compounds 4-((4-bromobenzylidene)amino)-5-methyl-4H-1,2,4-triazole-3-thion, 5-methyl-4-((thiophen-2-ylmethylene)amino)-4H-1,2,4-triazole-3-thion, 4-((2-chloro-6-fluorobenzylidene)amino)-5-methyl-4H-1,2,4-triazole-3-thion caused decline of diuretic activity. The most potent bioactivity was observed in 4-((4-methoxybenzyl)amino)-5-methyl-4H-1,2,4-triazole-3-thion.

**Conclusion.** Derivatives of 4-amino-5-methyl-4H-1,2,4-triazole-3-thion exhibit both diuretic and antidiuretic effects. "Structure – effect" relation was shown. The most potent activity was observed in 4-((4-methoxybenzyl)amino)-5-methyl-4H-1,2,4-triazole-3-thion.

## Пошук нових діуретичних речовин серед похідних 4-аміно-5-метил-4Н-1,2,4-триазол-3-тіону

Т. В. Кравченко

Похідні 1,2,4-триазолу широко застосовують у медичній практиці завдяки великому спектру біологічної дії та низькій токсичності, що зумовлено наявністю в їхній структурі триазольного циклу. Цей факт робить особливо перспективним і цікавим дослідження фізико-хімічних і біологічних властивостей цього класу органічних сполук. Для пошуку нових потенційно біологічно активних речовин синтезували 20 нових сполук, які раніше не описані у фаховій літературі, – похідні 4-аміно-5-метил-4Н-1,2,4-триазол-3-тіонів.

**Мета роботи –** дослідження діуретичної активності похідних 4-аміно-5-метил-4Н-1,2,4-триазол-3-тіонів.

**Матеріали та методи.** Сполуки синтезували на кафедрі токсикологічної та неорганічної хімії ЗДМУ. Для встановлення впливу сполук на екскреторну функцію нирок використовували метод Е. Б. Берхіна.

**Результати.** Дослідили діуретичну активність похідних 4-аміно-5-метил-4Н-1,2,4-триазол-3-тіонів. Вони проявляють як діуретичний, так антидіуретичний ефект. Досліджуючи діуретичну дію 4-((R-іден)аміно)-5-метил-4Н-1,2,4-триазол-3-тіонів, слід відзначити, що вони виявляють помірний і високий діуретичний ефект. Так, введення в молекулу 4-((R-іден)аміно)-5-метил-4Н-1,2,4-триазол-3-тіону 3,4-метоксибензилового, 3,5-метоксибензилового та 2-хлор-6-фторбензилового радикалу призводить до незначного посилення діуретичного ефекту. Відновлення сполук II, III, IX призводить до послаблення діуретичної дії. Найбільш активним є 4-((4-метоксибензил)аміно)-5-метил-4Н-1,2,4-триазол-3-тіон.

**Висновки.** Похідні 4-аміно-5-метил-4Н-1,2,4-триазол-3-тіонів проявляють як діуретичний, так і антидіуретичний ефект. Встановили взаємозв'язок «структурна – дія». Найбільш активною сполукою є 4-((4-метоксибензил)аміно)-5-метил-4Н-1,2,4-триазол-3-тіон.

## Поиск новых диуретических веществ среди производных 4-амино-5-метил-4Н-1,2,4-триазол-3-тиона

Т. В. Кравченко

Производные 1,2,4-триазола получили широкое применение в медицинской практике благодаря значительному спектру биологического действия и низкой токсичности, что обусловлено наличием в их структуре триазольного цикла. Этот факт делает особенно перспективным и интересным исследование физико-химических и биологических свойств данного класса органических соединений. Для поиска новых потенциально биологически активных веществ синтезировали 20 новых соединений, ранее не описанных в специализированной литературе, – производные 4-амино-5-метил-4Н-1,2,4-триазол-3-тионов.

**Цель работы –** исследование диуретической активности производных 4-амино-5-метил-4Н-1,2,4-триазол-3-тионов.

**Материалы и методы.** Исследуемые соединения были синтезированы на кафедре токсикологической и неорганической химии ЗГМУ. Для установления влияния соединений на экскреторную функцию почек использовали метод Е. Б. Берхина.

**Результаты.** Исследована диуретическая активность производных 4-амино-5-метил-4Н-1,2,4-триазол-3-тионов. Они проявляют как диуретический, так антидиуретический эффекты. При исследовании диуретического действия 4-((R-иден)амино)-5-метил-4Н-1,2,4-триазол-3-тионов следует отметить, что они проявляют умеренный и высокий диуретический эффект. Введение в молекулу 4-((R-иден)амино)-5-метил-4Н-1,2,4-триазол-3-тиона 3,4-метоксибензилового, 3,5-метоксибензилового и 2-хлор-6-фторбензилового радикала приводит к незначительному снижению диуретического действия. Восстановление соединений II, III, IX приводит к снижению диуретического действия. Наиболее активным является 4-((4-метоксибензил)амино)-5-метил-4Н-1,2,4-триазол-3-тион.

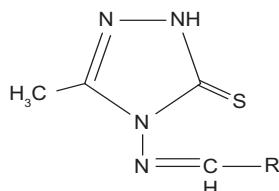

**Выводы.** Производные 4-амино-5-метил-4Н-1,2,4-триазол-3-тионов проявляют как диуретический, так и антидиуретический эффект. Установлена взаимосвязь «структура – действие». Наиболее активным соединением является 4-((4-метоксибензил)амино)-5-метил-4Н-1,2,4-триазол-3-тион.

## Introduction

1,2,4-triazoles are one of the novel and promising substances among high variety of organic heterocyclic compounds, which show wide range of biological activities and have low toxicity. In literature, scientists have been paying attention in their researches on diuretic activity of thioderivatives of 1,2,4-triazole. Considering results of the studies, further researches in this field may hold promise to obtain such substances [1–7].

It is known that therapeutic and clinical effects of diuretic agents are related not only to increasing of diuresis. Diuretics are often being prescribed also to treat arterial hypertension and cardiovascular, liver and kidney diseases, which are followed by edema [8–16].

Diuretic activity of studied new substances may be highly valuable for medical treatment of various severe conditions of the body. This had determined objective of the study, which was conducted to estimate effects of 4-amino-5-methyl-4Н-1,2,4-tiazole-3-thion derivatives on excretory function of kidneys.

## The aim

The aim of work was to study diuretic activities of 4-amino-5-methyl-4Н-1,2,4-tiazole-3-thion derivatives.

## Materials and methods

Compounds for research were synthesized at the Department of Toxicological and Inorganic Chemistry of ZSMU.

Berchin [17] method was used in order to estimate the effect of compounds on excretory function of kidneys. 7 Rats were used in each series of experiment, which were continuously held on a diet and had free access to water. Before the experiment animals were deprived from food and water for 2 hours. Then, gastric tube was used to introduce dose of 1/10 LD<sub>50</sub> of the substances in water suspension stabilized in Tween-80 into animals' stomach. 30 minutes later drinking water was introduced with loading of 5 ml per 100 g of body mass. Urine was collected in 2 and 4 hours.

## Results and discussion

Statistical analysis of the obtained results was conducted using parametric statistics (Student's t-test). Substances "Hypothiazid" by Sanofi-Aventis Ukraine®, "Furosemide" by Darnytsia® were used for comparison.

Studies of diuretic activities among 1,2,4-triazole derivatives were reviewed. The studies of our state's scientists approve that 4-R-5-R1-1,2,4-triazol-3-thione derivatives demonstrate diuretic activities [18,19].

Researchers have also obtained patents of Ukraine for 3-((2-chloroethyl)thio)-4-ethyl-5-(phenoxyethyl)-4Н-1,2,4-triazole and 4-ethyl-3-(phenoxyethyl)-5-((2-((5-(phenoxyethyl)-4-phenyl-4Н-1,2,4-triazol-3-yl)thio)-ethyl)thio)-4Н-1,2,4-triazole [20].

Therefore, the objects of this research of diuretic activities were new 4-amino-5-methyl-4Н-1,2,4-triazol-3-thiones.

Diuretic activities of 4-amino-5-methyl-4Н-1,2,4-triazole-3-thion derivatives were studied. It is worth noting that 4-((R-idene)amino)-5-methyl-4Н-1,2,4-triazole-3-thion derivatives demonstrated both moderate and high diuretic activity. In such way, introduction of 3,4-dimethoxyben-

\*: P < 0.05 in relation to the reference.

zyl, 3,5-dimethoxybenzyl and 2-chloro-6-fluorobenzyl radicals into the structure of 4-((R-idene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion slightly increased the diuretic effect. Compounds 4-((4-fluorobenzylidene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion, 4-((3-fluorobenzylidene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion and 4-((4-methoxybenzylidene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion showed more potent activity, then substance hypothiazide used for comparison.

It is worth mentioning that introduction of thiophene-2-ylmethyl, 2,3-dimethoxybenzyl and 4-bromobenzyl radicals into the structure of 4-((R-idene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion increased its diuretic effect as well. The highest bioactivity among 4-((R-benzylidene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion derivatives was observed for 4-((3-bromo-4-fluorobenzylidene)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion.

Reduction of compounds II, III, IX caused decline of diuretic activity (substances XII, XIII, XIX).

Substitution of thiophene-2-ylmethyl radical by 3-fluorobenzyl, 3,4-dimethoxybenzyl, 2,3-dimethoxybenzyl radicals in the structure of 4-((R)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion slightly increased the diuretic effect.

Reduction of compound VII led to decline of diuretic effect (substance XVII). Reduction of compound IV caused significant enhancement of diuretic activity.

## Conclusions

1. Diuretic activities of 4-amino-5-methyl-4*H*-1,2,4-triazole-3-thion derivatives were studied using Berchin method.
2. Derivatives of 4-amino-5-methyl-4*H*-1,2,4-triazole-3-thion demonstrate both diuretic and antidiuretic effects.
3. "Structure – effect" relation was shown.
4. The most potent activity was observed for 4-((4-methoxybenzyl)amino)-5-methyl-4*H*-1,2,4-triazole-3-thion.
